Concept:

The **allantois** stores **urinary waste** , and helps with the **exchange of gases** in general, which makes it a crucial structure since it delivers oxygen to the embryo. It also has a very important role in egg-laying animals, including all birds, as *it serves as the embryo's respiratory organ together with the chorion* . It is a **hollow sac-like structure** filled with clear fluid that forms part of a developing amniote's conceptus (which consists of all embryonic and extra-embryonic tissues). It helps the embryo exchange gases and handle liquid waste.
