Concept:**Production Of Jute Fibre**

The **jute fiber** comes from the **stem** and **ribbon** (outer skin) of the **jute plant** . The fibers are first extracted by **retting** . The **retting process** consists of **bundling jute stems together and immersing them in slow running water** . There are two types of retting: **stem** and **ribbon** . After the retting process, stripping begins; women and children usually do this job. In the **stripping process**, non-fibrous matter is scraped off, then the workers dig in and grab the fibers from within the jute stem.
